7 Frequently Asked Questions **5**

1 Welcome to Purse

Purse is a private, intelligent financial copilot and digital ledger. With Fiona—a friendly, knowledgeable financial secretary—users can manage money, budget envelopes, cash flow, and crypto wallets without surrendering private bank credentials to third-party cloud servers.

The source documentation states that information logged in Purse stays on the user's device in browser-local storage.

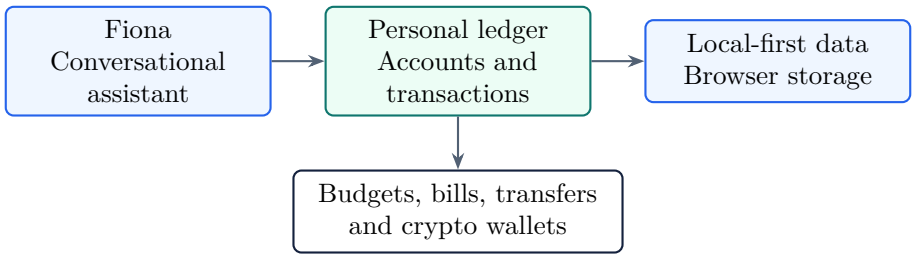

Figure 1: Main user-facing concepts in Purse.

2 Getting Started and Account Setup

When first opening Purse, users can choose one of three setup paths.

2.1 Option A: Start from Scratch (Default Cash Account)

1. Click **Start from Scratch** on the initialization screen.
2. Purse configures a **Physical Cash Wallet** (`type: cash`) by default, without requiring a bank or institution.
3. Enter the initial cash balance, for example `$250.00`.
4. Click **Create CASH Account & Enter Purse**.

2.2 Option B: Add Crypto Wallets and Bank Accounts

Purse supports the following account classes:

Table 1: Account types available in the guide.

Account type	Examples / fields	Typical use
Cash	Physical cash, envelope cash, cash pockets, petty cash	Cash-first bookkeeping
Crypto wallet	Phantom on Solana, MetaMask on Ethereum, Bitcoin cold storage; network and optional public address	Web3 assets
Checking	Operational bank account	Payroll and debit-card activity
Savings vault	Emergency reserves and high-yield savings (HYSA)	Liquidity reserve
Credit card	Revolving credit line and rewards card	Credit spending
Investment account	Brokerage and equity holdings	Investment tracking

New accounts can be created from the Overview dashboard using + **Add Account**, or by asking Fiona in chat.

2.3 Option C: Import Statements with AI

1. Select **Import with AI** in the ledger setup modal.
2. Drag and drop a bank CSV export or statement file, or paste raw transaction text.
3. Choose an AI reasoning engine, such as Gemini 3.8 Flash.
4. Click **Analyze & Organize**. The AI organizes merchants, assigns categories, and separates income from expenses.

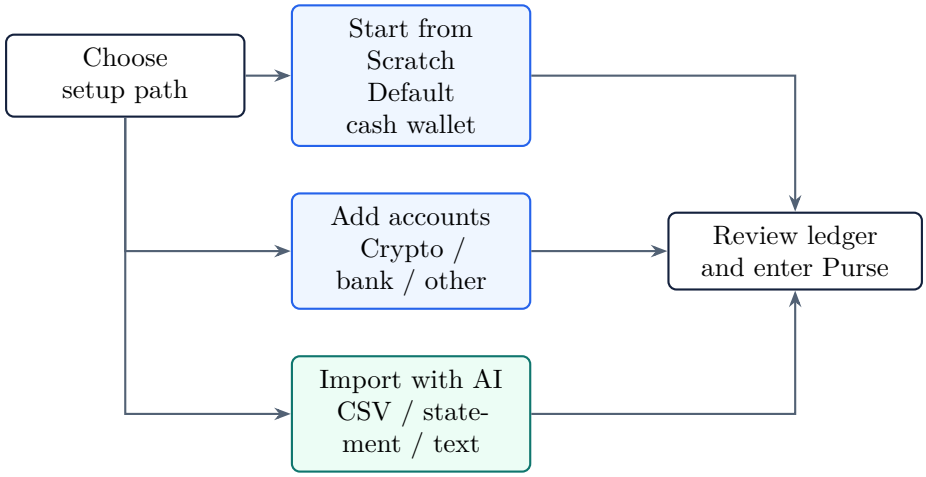

Figure 2: Three documented setup paths.

3 Chatting with Fiona

3.1 General knowledge and advice

Fiona can answer general questions beyond personal finance, and should not redirect these queries to account balances. Example prompts include:

- *"Tell me what you know about BRAC University."*
- *"What is the difference between an index fund and a mutual fund?"*
- *"Can you explain how compound interest works with a quick example?"*
- *"How is the weather today?"* or *"Good morning Fiona!"*

3.2 Operating on accounts and the ledger

Users can describe financial actions in natural language. Examples from the guide:

Table 2: Example natural-language commands.

Task	Example prompt
Log cash spending	"I spent $14 in cash at Joe's Diner for lunch."
Add found cash	"I found $40 in cash in my coat pocket, add it to my cash wallet."
Log a crypto transaction	"Record a 50 USDC purchase on Solana for digital tools."
Create a crypto account	"Add a Phantom crypto wallet on Solana with a $350 balance."
Create an envelope	"Create a Vacation Cash Envelope with $200."
Transfer funds	"Transfer $100 from my checking account to my cash wallet for weekend spending."
Ask a budgeting question	"Can I afford a $120 dinner tonight?"
Check runway	"What is my zero-income cash runway right now?"

3.3 Safe Execution Proposal Gate

Fiona does not commit ledger changes without user review. The documented flow is:

1. Fiona recognizes an instruction that changes financial records and creates a Safe Execution Proposal Card.
2. The card displays details such as the proposed account, amount, merchant, and category.
3. Review the proposal, then click **Approve & Execute** to commit it, or **Decline** to cancel.

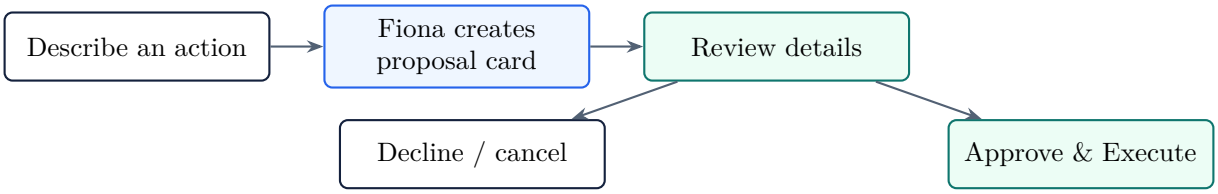

Figure 3: User-confirmed financial action flow.

4 Dashboard and Navigation

4.1 Overview Dashboard

- **Luxury Account Card:** Switch between Cash, Crypto, Checking, and Savings accounts; view balance, institution, network, and account mask.
- **Safe To Spend Today:** Daily discretionary allowance after fixed housing, bills, and emergency savings are reserved.
- **Emergency Cash Runway:** Estimated months survivable with zero incoming revenue, pooling liquid cash and checking accounts.
- **Agent Mutation Stack (Safe Rollback):** Use **Undo** beside a recently applied action to revert it.

4.2 General Ledger

- View transactions by date, payee, account, category, notes, and amount.
- Filter by account, category, or transaction type (Expenses, Income, Transfers).
- Export the ledger to CSV or import past logs.

4.3 Envelopes and Budgets

View monthly allocations across Needs, Wants, and Savings. Progress bars indicate budget status and warn when spending approaches limits.

4.4 Scheduled Bills

Track recurring software subscriptions, utilities, and rent. Alerts highlight upcoming due dates and possible duplicate subscription leaks.

4.5 Memory Core

Fiona's long-term operational guidelines and financial invariants are stored in the Memory Core. Example rules include:

- *"Always maintain at least $1,000 checking balance."*
- *"Never invest in illiquid assets without 3 months emergency runway."*

5 Voice Interaction and 3D Avatar

- **Speaking to Fiona:** Click the microphone button in the chat input bar. Purse uses the browser's native Web Speech API for speech recognition.
- **Listening aloud:** Click **Listen aloud** below a Fiona reply to hear text-to-speech narration.
- **3D mode:** Click the **3D** toggle in the top bar to expand Fiona into a waist-height 3D companion with animated gestures and mouth lip-sync.

6 AI Models and Privacy Settings

Open **Settings** or click the model pill at the top of Chat to configure the reasoning engine.

Table 3: AI model options documented in the user guide.

Provider / mode	Model	Description in source
Google Gemini	`gemini-3.8-flash`	Default; high-speed, high-reasoning multimodal engine.
OpenAI	`gpt-4o-mini`	Conversational model option.
DeepSeek	`deepseek-chat`	Cost-effective reasoning.
Z.ai	`glm-4-flash`	Fast multilingual engine.
Browser Edge LM	`smolLM2-135M-instruct`	Offline local browser inference via WebGPU / ONNX; no external API calls.

The guide states that API keys are saved in local device storage and are not uploaded to remote analytics services.

7 Frequently Asked Questions

Do I need a bank account to use Purse?

No. Purse defaults to a Physical Cash Wallet that does not require a bank, credit union, or financial institution. It can be used for cash, crypto, or traditional banking.

Where is my financial data stored?

According to the guide, accounts, transactions, bills, and vector memory are stored on the user's device in browser persistent local storage and CacheStorage.

Can I undo a transaction if the AI made an error?

Yes. Fiona prompts for confirmation before committing a transaction, and committed actions can be undone using the **Undo** button on the Overview dashboard.

Document Notes

This edition reorganizes the supplied EUD Markdown into a typeset user guide with tables and diagrams. Instructions, example prompts, feature descriptions, and privacy statements are based on the source document and have not been independently verified.
